Executive Summary

The Marine Industry Skills Gap and Job Vacancy Survey was designed to provide a statistically valid analysis of the nature of skills gaps in the three counties in the Miami-Fort Lauderdale-West Palm Beach Metropolitan Statistical Area (MSA) for the marine industry cluster. The existence of skills gaps has been a matter of much discussion among employer groups, industry associations, labor economists, and in the workforce system. To research skills gaps, CareerSource Florida, in coordination with CareerSource Broward, funded a pilot project survey conducted in 2016 by the Florida Department of Economic Opportunity (DEO), Bureau of Labor Market Statistics (LMS). The pilot survey was successful and LMS now has the capability to conduct these types of surveys for different geographic and custom industry configurations. Building on deep knowledge and experience in conducting local job vacancy surveys, LMS designed a survey instrument that collected skills gaps and job vacancies along with the attributes of vacancies. A total of 31 individual skills gaps could be collected based on seven broad skills questions.

The final survey results measured 1,352 job vacancies with the largest number of vacancies being in the Deep Sea Passenger Transportation industry. The number of hard skills gaps reported were lower than those for soft skills however, the ratio of soft to hard skills gaps was much less than for the entire state across all industries. Information technology/research related skills ranked first among hard skills gaps while leadership ranked first among soft skills gaps. There were an estimated 1,335 total weighted gaps within the industry cluster.

The Support Activities for Water Transportation industry had the highest gap per vacancy measure for soft skills, while Sporting Goods and Merchant Wholesalers had the highest measure of gap per vacancy for hard skills of all the detailed industries in the marine cluster. The Construction and Extraction major occupation group reported the most soft skills gaps per vacancy. The Installation, Maintenance, and Repair major occupation group reported the most hard skills gaps per vacancy. Employers without gaps were asked how they avoided skills gaps in hiring, recruitment, training, and retention. More than one-third of the skills gap mitigation responses indicated that applicants are screened carefully before hiring. Next, the most used gap mitigation technique was to retain high skilled/productive staff.

According to these employers, skills gaps are found across a wide range of occupations and education levels in these labor markets. As such, the survey results provide one of the clearest signals from marine industry employers to the workforce, education, and economic development partnerships about employers’ skills needs. Skills are a key to a growth economy and a viable labor market for employees, students, and jobseekers.

Upgraded skills will help Florida’s workers and employees be more competitive in the production of the goods and services demanded by state, national, and international economies. The results of enhanced skills to Florida’s workers will include better wages, increased wage gains, higher rates of job retention, broader opportunities for career advancement, and more stable and rewarding career pathways. For the workforce and education partnerships, enhancements made to wraparound services, training, and curriculum developed from gap results could make the workforce and education systems much more effective in meeting the skills needs of private-sector employers. The skills gap survey results contain enough actionable data to inform both individual workers and the industries (and employers) who need higher skilled workers.
Marine Industry Survey of Skills Gaps and Job Vacancies

Survey Goals
The purpose of the survey was to collect labor market information on the marine industry cluster for each of the three counties in the Miami-Fort Lauderdale-West Palm Beach MSA. The counties that comprise the MSA are Miami-Dade, Broward, and Palm Beach. The survey was designed to collect job vacancies and vacancy attributes in the MSA with skills gaps and to identify whether gaps are soft skills such as reliability/time management, communication-related, leadership, problem-solving or hard skills such as math, technology/research, and workplace-related skills such as safety. Though job vacancy data were collected, the major focus of the survey was on skills gaps. The survey was also intended to provide insights on how businesses mitigate against skills gaps in hiring, retention, and staff development. By following the basic design and methods of prior Job Vacancy/Hiring Needs Surveys, LMS was able to capitalize on experiences gained to collect and analyze skills gap data.

The final results were designed to be actionable, enabling workforce, economic development, and education partners to modify their operations and service delivery to be more aligned to meet the skills needs of private-sector employers in the marine industry.

Background
The marine industry is a critical component in the economies and labor markets of Southeast Florida. This industry cluster provides goods and services to several parts of the economy. Boat and ship manufacturing is one of the major goods-producing components to the marine industry. This industry provides boats for the recreational market and repair and fitting services for the commercial shipping market. Intracoastal and deep-water transportation services deliver the goods needed by the Florida economy while marinas and cruise lines support tourism and recreational services. There are approximately 1,800 employers in this industry representing 28,000 direct jobs in the MSA.

One of the latest innovations in data collection to support employers is skills gap research. CareerSource Broward has been a state leader in its support of Job Vacancy/Hiring Needs surveys and in promoting skills gap research. To further serve Broward County employers, CareerSource Broward agreed to host a pilot project in 2016 to collect skills gaps. The pilot survey was successful and solved all the major technical issues with reporting and estimating skills gaps. Because of this success, LMS was able to proceed with the full statewide survey of all 24 Local Workforce Development Areas in 2017. This survey and study was one of the largest efforts to date addressing the issue of skills gaps in the labor market. The Marine Industry Skills Gap and Job Vacancy Survey builds on these experiences; however, this was the first skills gap study targeting an industry cluster.

Sample Frame and Selection
The survey sample was drawn from a file of employers covered by Florida’s Reemployment Assistance law using U.S. Bureau of Labor Statistics (BLS) methods and software. The sample included only private-sector establishments, and was stratified by six size classes within detailed North American Industry Classification System (NAICS) industries. The marine industry cluster consists of twenty separate detailed (six-digit NAICS) industries. These are provided in Appendix II. Each of the three counties had separate samples drawn from the universe of establishments in the cluster industries. Establishments were selected at random within the size/industry strata, except for large firms (250+ employment) of which all were included. All establishments in the fishing industry in the three-county area were also included in the survey. Utilizing this methodology resulted in a representative sample for each county and industry size strata. Each sample member was assigned
a strata code (combination of industry and size) and a weight (the count of total establishments divided by the number of sample establishments in each strata) that was used to produce the final estimates. A total of 844 establishments were in the final cluster sample.

**Survey Instrument Design**
A search of other skills gap surveys helped to identify effective survey structures and viable questionnaire wording for skills gaps. The final survey design conformed to widely-used questions from job vacancy surveys, with skills gap questions added. The survey instrument was designed to first collect job vacancies, along with vacancy attributes, with a structured loop from the vacancy questions to address the skills gap questions. This provided a direct link between active job vacancies and the barriers to filling them. The gap questions were divided into seven major skills groups and then broken down further into soft and hard skills. The final design of 19 soft skills and 10 hard skills with an additional open-ended “other” skills gap selection for each. If an establishment reported no gaps, they were asked how gaps were avoided in hiring, retention, and recruitment (gap mitigation). There were four gap mitigation choices and an “other” mitigation category. If the establishment reported no vacancies, they were asked if they were experiencing skills gaps in any occupations for which they had no current vacancies. If they reported yes, they were asked to identify the occupations and related skills gaps. See Appendix I for the final survey questions.

**Data Collection**
The survey data collection was conducted by DEO contractor, Oppenheim Research. The survey was conducted by phone using CATI technology. This method of data collection has proven response times, provides excellent sample control, and allows for monitoring with minimal employer burden.

**Estimation of Vacancies and Skills Gaps**
All the sample establishments in the survey were assigned an estimating stratum that was based on the parameters set when the sample was designed and selected. For example, one of the strata in size class 1 of an industry, contained 224 employers. The sample selection software indicated that 10 employers were needed to represent this stratum. Consequently, this stratum was assigned a weight of 22.4 (224/10) when the sample was selected using BLS software. When the job vacancy, attributes, gaps, and gap mitigation data were collected by an establishment, they were arrayed by estimating strata and each numeric response was multiplied by the weight. Additional weighting was applied due to survey nonresponse within the estimating strata. The goal was to account for all survey units and employment originally found in all the size/industry estimating strata. The final estimate for occupational vacancies was the aggregate weighted estimate for the occupation by estimating strata. Vacancy attributes (full-time/part-time, temporary/permanent, experience requirements, etc.), skills gaps, and gap mitigations were weighted and aggregated the same way. All data reported were subjected to extensive review including coding, proper data format, and adherence to data definitions.

Final estimates for skills gaps were calculated. The total number of skills gaps could be high as they represented responses for all establishments in an area. Job vacancy data were calculated as the number of estimated vacancies by occupation and these could be combined to provide data by occupational group or industry.

**Job Vacancies**
Figure 1 shows estimated vacancies by detailed industry. Most of the vacancies were in Deep Sea Passenger Transportation (331) followed by Boat Dealers (201). Other Transportation Goods Merchant Wholesalers ranked third with 157 estimated job vacancies. There were 1,352 estimated job vacancies across all cluster industries in the three county MSA.
The Standard Occupational Classification (SOC) system is used by government agencies to assist in the collection and analysis of occupational data. The two-digit SOC codes are used in reporting aggregate occupations at the broadest SOC level (major occupational groups). Figure 2 shows the 10 major occupational groups in the marine cluster with the most vacancies. Office and administrative support occupations had the most vacancies (205) followed by management occupations (199). Installation, maintenance and repair...
occupations ranked third (197 vacancies). Note that the top two major occupational groups by vacancy contain occupations used by all industries in the marine cluster.

Figure 3 shows the 15 occupations in the marine industry cluster with the most vacancies. Examining occupations by estimated vacancies measures the demand for the knowledge, skills, and abilities (KSAs) within the occupation. These are the KSAs needed by employers to deliver the goods and services produced by the marine industry cluster and in demand by the economy. The first occupation is highly concentrated in the marine cluster, *Motorboat Mechanics and Service Technicians* with 90 vacancies followed by *Waiters and
Waitresses (71 vacancies) and Accountants and Auditors (40 vacancies). The last two occupations are more likely to work in a variety of industries within the marine cluster.

**Job Vacancy Attributes**
The attributes of job vacancies were also collected along with the number of vacancies. Attributes included permanent/temporary status, full-time/part-time, required experience in years and whether the job required a certification or license, how long the vacancy had been open (in days), and the education requirement specified by the employer. Attributes were important since they provided more detailed information about the nature
of the vacancy. Vacancies open for an extended length could be classified as hard-to-fill and possibly in shortage, while education requirements specify what the employer specifically needs. This was an important measure and provided better indication of employer-based needs. Overall, the marine industry in the three-county MSA had much higher educational requirements than all industries across the state in addition to having a slightly higher share of permanent positions. Educational requirements were much higher in MSA marine industries than all industries in the state, and a higher percent of marine vacancies were open between 30 and 59 days and for more than 60 days (indicating that they may be harder to fill).

A clear majority of marine cluster vacancies (92.2 percent) were for full-time positions, as shown in Table 1B. Nearly one-third required between one and two years of experience, as shown in Table 1C. Over five years of experience was required for 21.7 percent of vacancies.
Almost three in four of reported vacancies (73.7 percent) required no certificate or license requirement (996) and under one-third of vacancies (406) were open for less than 30 days, as reported in Tables 1D and 1E. Of total vacancies, 15.7 percent or 212 were open for more than 60 days. Employers were always recruiting and hiring for 6.4 percent of vacancies, while 38.7 percent did not define the length of the vacancy.

</tbody>
</table>

Note: Total estimated vacancy counts may differ due to varying valid response totals received for each question. Values may not sum to the total due to rounding.

Table 1F shows the minimum education level required for the reported vacancies. The most frequent education requirement of vacancies reported was for high school or GED (30.3 percent), followed by a bachelor’s degree (27.5 percent). A total of 42.4 percent of the reported vacancies required an education level beyond high school. This is much higher than the percent requiring education above high school for the entire state across all private-sector industries (28.1 percent).

Skills Gaps
Employers reported skills gaps in applicants applying for vacancies from a list of four major soft skills groups and three major hard skills groups. These were estimated like vacancies with the sample weight and nonresponse adjustments applied to provide gap totals for all gap measures across all employers in the private sector. These were then converted to a skills gap per vacancy by dividing by the number of vacancies in each industry, occupational group, and occupation. Each major soft and hard skills gap group was comprised of detailed skills. For example, the major soft skills gap group Reliability and Time Management included the detailed skills of Attendance, Meeting Deadlines, and Dependability. Figure 4 displays a list of detailed skills categories that make up each major skills gap group. The “other soft skills” and “other hard skills” fields provided respondents with the opportunity to write in skills gaps that they experienced, but felt that they did not fit into any of the predefined categories.

**Gap Mitigation**

Marine industry employers reported a higher proportion of skills gaps as compared with the Statewide Skills Gap & Job Vacancy survey of all private industries. This indicates that the marine industry had a harder time filling vacancies. If employers reported no skills gaps, they were asked how they avoided gaps in hiring, training, and retention. Four options were available to report gap mitigation (screen applicants carefully, then hire; hire and then train or upskill; retain high skill/productive staff; contract out/outsour.

Across all marine cluster industries, careful screening practices, used by 98.9 percent of employers, and retaining valuable staff (96.5 percent of employers) were the most favored techniques. Outsourcing was the least used gap mitigation method (6.6 percent).

The top 25 occupations, by ratio of skills gap scores to vacancies available for the occupation, were also evaluated. *Security Guards* were ranked the highest by this metric, with an overall score of 3.04 gaps to every vacancy, followed by *Shipping, Receiving, and Traffic Clerks* (2.87). Employers of both occupations typically used screening, training, or upskilling and then retention as a way of mitigating skills gaps. For the top 25

occupations, careful screening was the most frequently reported gap mitigation method, followed by retention methods. Outsourcing was the least frequently reported mitigation technique by industry, however, outsourcing was used extensively to provide gap mitigation for two occupations: Motorboat Mechanics and Security Guards.

**Gap Measurement**

Figure 5A reports the frequency of occurrence for soft skills gaps in the marine industry cluster. Communication-related skills as well as reliability and time management were the most significant soft skills gaps reported in Florida. Gaps in leadership skills occurred in 14.2 percent of all vacancies and gaps in reliability and time management skills occurred in 12.8 percent of all vacancies.

![Figure 5A Soft Skill Gap Totals](image)

Note: Total estimated vacancy counts may differ due to varying valid response totals received for each question. Values may not sum to the total due to rounding.

Figure 5B reports the rate of occurrence of hard skills gaps in the marine industry cluster. Gaps in hard skills were reported less frequently than gaps in soft skills. Information technology/research-related skills represented the largest estimated hard skills gaps across all sectors, with skills gaps occurring in 14.2 percent of vacancies.
Among employers reporting skills gaps, the ratio of soft skills to hard skills gaps was 1.49 compared to the statewide all private industry ratio of 2.86. Hard skills gaps are therefore much more prevalent in the marine industry cluster than in the private-sector part of the state labor market.

Table 3A reports the rate of occurrence of soft skills gaps by detailed industry. The number in the column “Number of Skills Gaps per Vacancy” indicates the average number of soft skills gaps per vacancy reported. For example, the two industries that reported the largest overall gaps per vacancy were Support Activities for Water Transportation (1.82) and Boat Building (1.43).

The percent in each skills column can be interpreted as the percent of vacancies in which a skills gap had been reported in each industry listed. For example, 69.6 percent of the job vacancies in the Boat Building industry had reported leadership skills gaps compared to the 24.2 percent of the job vacancies in the Boat Dealers industry.

The industries that most frequently reported leadership gaps were Support Activities for Water Transportation (63.6 percent) and Boat Building (69.6 percent). Of all the detailed industries, Navigational Services to Shipping had the largest soft skills gap rates in the areas of reliability and time management (66.7 percent). Boat Building had the highest percent of communication-related gaps (43.5 percent). Problem-solving skills gaps occurred less frequently than the four other soft skills gaps.

Table 3B reports the rate of occurrence of hard skills gaps by detailed marine industry. Sporting Goods Merchant Wholesalers and Boat Dealers reported the largest overall numbers of gaps per vacancy at 1.24 and 0.98 hard skills gaps per vacancy, respectively. The hard skills gaps reported by Sporting Goods Merchant Wholesalers and Boat Dealers firms were driven by information technology/research-related gaps as well as other skills. Boat Dealers had the highest percent of vacancies among all marine industries with math-related hard skills gaps (19.4 percent).

Skills Gaps by Major Occupational Group

Table 4A breaks down the soft skills gaps by each major occupational group. Because of the concentration of occupations in the marine cluster, only 12 of the 22 major occupational groups reported soft skills data in the survey.

Construction and Extraction Occupations had the largest ratio of total soft skills gaps to vacancies with 1.03 gaps per vacancy. Gaps in leadership, reliability, and time management were the most frequent for this occupation group, with employers reporting that 52.7 percent of vacancies featured a gap for the former and 34.8 percent for the latter. Production Occupations had the second-highest ratio of total gaps per vacancy with 1.02. Gaps in reliability and time management (26.7 percent) followed by leadership-related skills (25.4 percent) were the most frequent for this occupation group. Transportation and Material Moving Occupations had the third-highest ratio of total soft skills gaps to vacancies with 1.01 gaps per vacancy, followed by Sales and Related Occupations with 0.92 gaps per vacancy. Gaps in leadership skills were the most commonly cited soft skills gap for Transportation and Material Moving Occupations, with 29.2 percent of vacancies experiencing such a gap. The second-highest percent for soft skills gaps on the table is for communication-related skills in Building and Grounds Cleaning and Maintenance Occupations (40.9 percent).

Table 4B breaks down each hard skills gap by major occupational group. Only nine of the 22 major occupational groups reported hard skills gap data, again due to the concentration of certain types of occupations in the marine industry cluster. Installation, Maintenance and Repair Occupations had the highest gap per vacancy measure (0.77) followed closely by Architecture and Engineering Occupations (0.76). Gaps in information technology/research-related skills were most commonly reported for Installation, Maintenance and Repair Occupations (33.4 percent of vacancies), as were gaps in workplace-related skills (17.7 percent of vacancies).

</tbody>
</table>

Note: Total estimated vacancy counts may differ due to varying valid response totals received for each question. Values may not sum to the total due to rounding.

Soft skills gaps were reported most commonly among vacancies for Automotive and Watercraft Service Attendants, Welders, Cutters, Solderers, and Brazers, and Electrical and Electronics Installers and Repairers, Transportation Equipment with skills gaps to vacancy ratios of 2.07, 1.59, and 1.56, respectively. Gaps in information technology/research skills were either the largest contributor or tied for the largest in each of these occupations, with vacancies in these three occupations experiencing IT/research gaps at a rate of 69 percent or higher. Gaps in the “other”
category also occurred frequently in vacancies across a number of occupations, with seven of the 15 occupations experiencing other gaps at a rate of 25 percent or higher.

Educational Attainment
Job vacancies for different occupations often require different levels of educational attainment. Occupations reported in the skills gap survey were matched to their respective Florida education levels. The Florida education levels represent the minimum educational level for a given occupation as defined by the Florida Department of Education. The Florida education levels are different than the education levels reported by the employers in Table 1F. Table 6 shows the most common soft skills gap for each level of educational attainment.

<table>
<thead>
<tr>
<th>Education Level</th>
<th>Most Common Soft Skills Gap</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than High School</td>
<td>Communication Skills</td>
</tr>
<tr>
<td>High School Diploma/GED</td>
<td>Leadership Skills</td>
</tr>
<tr>
<td>Postsecondary Vocational</td>
<td>Leadership Skills</td>
</tr>
<tr>
<td>Associate's Degree</td>
<td>Reliability and Time Management</td>
</tr>
<tr>
<td>Bachelor's Degree</td>
<td>Leadership Skills</td>
</tr>
</tbody>
</table>

Gaps in leadership skills were the most common soft skills gaps in occupations that require a high school diploma/GED, a postsecondary/vocational degree, and a bachelor’s degree. Occupations that require an associate’s degree had the most gaps in reliability and time management skills, while those that require less than a high school diploma had the most gaps in communication skills.

<table>
<thead>
<tr>
<th>Education Level</th>
<th>Most Common Hard Skills Gap</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than High School</td>
<td>Information Technology/Research Skills</td>
</tr>
<tr>
<td>High School Diploma/GED</td>
<td>Information Technology/Research Skills</td>

</tr>
<tr>
<td>Bachelor's Degree</td>
<td>Information Technology/Research Skills</td>
</tr>
<tr>
<td>Master's or Higher Degree</td>
<td>Information Technology/Research Skills</td>
</tr>
</tbody>
</table>

Table 7 shows the most common hard skills gap for each level of educational attainment. Information technology/research skills are the most common gaps for occupations of all education levels except for those that require a bachelor’s degree, which most frequently experienced gaps in other skills.
Conclusion

The Marine Industry Skills Gap and Job Vacancy Survey offers an insightful look into the real decisions employers face when confronted with today’s challenging and the rapidly changing workforce environment. Unlike aggregate data produced at the national level, this data provides a window into the specific challenges facing marine industry businesses in Miami-Dade, Broward, and Palm Beach counties. When compared to employers in all industries across the state, marine industry employers in this region reported greater trouble filling vacancies. When compared to employers in all industries across the state, marine industry employers in this region reported greater trouble filling vacancies. This is possibly a reflection of the higher skill and experience requirements related to reported vacancies for this industry and region.

The results of this study can be used to develop tools and strategies based on gap mitigation findings to promote gap mitigation and retention among employers struggling with retention issues. It also can be used to help better align workforce and educational training program outcomes and design to better fit employer-reported needs.

This study was made possible because of the participation of marine industry employers throughout Miami-Dade, Broward, and Palm Beach counties. The continued cooperation of employers, Local Workforce Development Boards, CareerSource Florida, and DEO in studies like this will help Florida become the nation’s top performing economy and be recognized as the world’s best place to live, learn, play, work and do business.

Job.Q5 What are the general responsibilities and description for this position?

| Job.Q6 | What minimum education level is required? |
|        | a. No education required |
|        | b. High school or GED |
|        | c. Vocational or technical training |
|        | d. Associate’s degree |
|        | e. Bachelor's degree |
|        | f. Advanced degree |
|        | g. Not specified |

| Job.Q7 | Is a license or certification required? |
|        | a. Yes |
|        | b. No |
|        | c. Not specified |

| Job.Q8 | How much work experience does this position require? |
|        | a. Less than 1 year |
|        | b. 1-2 years |
|        | c. 3-4 years |
|        | d. Over 5 years |
|        | e. Not Specified |

| Job.Q9 | How long has this position been vacant? |
|        | a. Less than 30 days |
|        | b. 30-59 days |
|        | c. 60+ days |
|        | d. Always hiring |
|        | e. Not specified |
Do applicants for this vacancy lack any of the following skills?

If no skills gaps ask gap mitigation question:

If you have no skills gaps, do you:

   a. Screen applicants carefully, then hire?
   b. Hire and then train or upskill?
   c. Retain high skill/productive staff?
   d. Contract out or outsource?
   e. Other (SPECIFY)

End Survey if no gaps and mitigation questions collected.

If yes to gap question collect both soft and hard skills by occupation.

SQ1: Do applicants for this vacancy lack any of the following skills related to reliability and time management?

   a. Attendance
   b. Meeting deadlines
   c. Dependability

SQ2: Do applicants lack any of the following communication-related skills?

   a. Interpersonal
   b. Reading and writing
   c. Phone etiquette
   d. Customer Service
   e. Sales
   f. Active listening
   g. Following directions

SQ3: Do applicants lack any of the following leadership skills?

   a. Management
   b. Team work/Team participation
   c. Initiative
   d. Motivation
   e. Entrepreneurial/business ideas

SQ4: Do applicants lack any of the following problem-solving skills?

   a. Critical thinking
   b. Analytical
   c. Research
   d. Trouble-shooting
SQ5: Are there any other soft skills applicants lack?

SQ6: Do applicants lack any of the following math skills?
   a. Arithmetic
   b. Accounting/Bookkeeping
   c. Logic
   d. Job-specific mathematics requirements

SQ7: Do applicants lack any of the following technology, information technology, or research-related skills?
   a. Computer/information technology usage
   b. System-specific job related
   c. Research
   d. Electrical/Electronic

SQ8: Do applicants lack any of the following workplace-related skills?
   a. Tool use and selection
   b. Safety skills

SQ9: Are there any other hard or technical skills applicants lack?

Note: This reflects the core questions of the 2017 survey and does not include instructions to interviewers or skip patterns used in the actual survey script. The actual survey was conducted using CATI technology. There are numerous checks used in the actual script to collect employment at the business site, verify area, and verify addresses and to find out if the employer would like to be contacted from the regional CareerSource staff.
